## ***Introducing the SmartWire Power Distribution Center***

**Get smart about wiring with Racepak's fully programmable SmartWire Power Control Module.**

The SmartWire is a programmable controller that replaces fuses, relays and circuit breakers into one compact module. Not only does this provide a more reliable and better controlled electrical system, but the SmartWire gives you the ability to program its operation.

Want to activate a secondary fuel pump when nitrous is activated? Activate a cooling fan or control a dome light after shutting the door? SmartWire can control advanced boost applications and even control things as simple as the flasher rate of a turn signal.

Through Racepak's DataLink software and a USB connection to your PC, you can define the function and power requirements of each channel. Not only is the operation of the complete system improved, but there will also be much less wiring routed throughout the car thanks to Racepak's exclusive single cable V-Net technology.

- 30 total outputs (8 channels @ 20-amp and 22 channels @ 10-amp)
- USB connection for PC programming of each channel
- 12 hardwired switch inputs
- Exclusive V-Net wiring reduces wiring and sensor duplication
- Seamless integration with Racepak instrumentation and data systems

The only limit to what you can control with the SmartWire is your imagination. Less wiring, increased control over anything electric, solid state reliability and Racepak experience make the SmartWire the intelligent choice.

For more information on the SmartWire, check out [www.racepaksmartwire.com](http://www.racepaksmartwire.com) or contact Manny Grijalva at [mgrijalva@msdperformance.com](mailto:mgrijalva@msdperformance.com), (949) 709-5555.
